

The Romantic Side of Electromagnetism

When people talk about love and meeting someone you just cannot get out of your mind, it's not uncommon to hear phrases such as "there's just chemistry between us" or "what we feel is electric, almost magnetic!", but what the heck are these people talking about? Well, just like magnets, people can have an undeniable pull towards one another (when the polarities are a match of course).

Like electromagnetism, the strongest force on planet earth, (no, it's actually *not* gravity), love could be considered the strongest force in universal consciousness, as it is what holds humanity together at its core. And I strongly believe that is why they feel so similarly on a cosmic level to which we are innately drawn to describe these types of experiences as feeling magnetic, electric, or energized.

We all know when we're in love how hard it is to be away from the person we're in love with. It's literally like there's an unseen force that binds your hearts together, and again I believe it is because there truly is. Love, like anything else in the Universe, is energy, and when combined with a dance of heartfelt emotion, again is the strongest, most binding, yet at the same time, most freeing force in all of existence as we know it.

Not even "science" can explain away the amazing things that love can do, or the seemingly unexplained "abilities" that people have obtained in the name of love, such as strength gained by a mother to save a child in duress. Or the knowledge of a wife when a husband is stranded without a way to contact her for help. Beyond the gaps of time and space, love is in and of itself a force that combines electricity and magnetism and if we look closely, we can see this expressed in the heart

muscle itself.

The heart produced the strongest electromagnetic field in the body, surpassing that of the brain by many feet. It even has its own “neurons” and what can be considered its very *own* brain. And it’s curious to take note as to how closely intertwined it is with the neurological system. The heart requires electricity to give it a “jump-start” if it ever stops beating, as it relies on electrical impulses to keep the rhythm we all know as our heartbeats.

If we look closer we can see the obvious signs and symbols the heart shares with the vast and grand mysteries of the forces of nature and the Universe, and of creation itself, we know as Electromagnetism. And I don’t think it’s a mistake that the innate feeling of connection to one another (what we feel when there’s soul chemistry) translates to anything other than that, as it makes so much sense that the key to connecting to our hearts, would be found in the door another opens within us.

I think there’s so much to learn from the forces of nature if we just take the time to slow down and acknowledge them. Perhaps that’s the hardest thing for many of us to do these

days, but perhaps it's also one of the most important. For if you find yourself with the least amount of time in your day for joy, then that is the surest indicator of how far you've strayed from listening to your own heart. Joy is freeing, not constricting, and once you connect to it, whether in your soulmate or dream job, the Universe lets you know with a little lightning bolt in your heart, a little pull towards your purpose with a shock of sureness. □
