Smaller homes run a whole gamut of creativity: from [hand-built earthen geodesic domes](#) to the current plethora of interesting tiny homes that are emerging beyond the early [Tumbleweed](#) days. [Nelson Tiny Houses](#), a builder based in British Columbia, created this impressive 380-square-foot dwelling using a fifth-wheel utility trailer as a base. The resulting design boasts a great layout: a comfortable sitting area, guest loft and a loft-less bedroom that feels like a room in its own right. Seth Reidy of Nelson Tiny Houses gives a tour of this home, now nestled in the mountains somewhere.

Dubbed the V House, the approximately 38' by 9' solar-powered home features an extra-wide deck and front door that opens into the sitting area. Thanks to a neat, transforming design involving mobile seating units and a folding bamboo table that can expand and become suspended from the ceiling with a cable, this area is made into a multipurpose space (dining, workspace and even guest bed). Above the sitting area is the spare bedroom loft.

The home is heated with [Hobbit wood stove](#) with a fresh air intake, and also has a heat pump installed in the kitchen. The kitchen is large, with lots of counter space, a full-sized

sink, oven, refrigerator, and pantry. Sliding doors on both ends of the adjoining bathroom save space.
